

## **Project Challenges**

During the project we have had some difficulties accessing the file uploaded on Azure blob storage.

First we started to use the new Form Recognizer Studio to create the custom model to extract the data from the boarding files, but we have failed.

The first difficulty was to access the file in the Azure Blob Storage Container. To resolve this issue we added a policy access with Form Recognizer Studio URL and racwdl permissions.

The second difficulty we had was to access the file from Azure Blob Storage to Form recognizer Studio project. We found out that when we create the project without any file in the Azure Blob Storage container and upload the file after creating the project that when we can access the file in the container.

After labeling all the files on Form Recognizer Studio we could not train the model. After some research we noticed that we needed the .fott file which was not generated with the new Form Recognizer Studio. We switched to the Form OCR Testing Tool where we were able to train our model.
